

Product Name :
Double Screw Fish Food Extruder

Product Code :
EQMH-CHINA-MY3001053

Description :

Double Screw Fish Food Extruder

Technical Specification :

A fish food machine is a device designed to automatically dispense food to fish in an aquarium or fish tank. These machines are typically used by aquarium hobbyists, pet stores, and aquaculture farms to feed fish on a regular schedule without the need for manual feeding.

There are a few different types of fish food machines available on the market. Some machines use timers to dispense food at specific times, while others use sensors to detect when the fish are approaching and dispense food accordingly.

Some machines can dispense both dry and wet food, while others are designed for one type of food only.

When choosing a fish food machine, it's important to consider factors such as the size of the aquarium or fish tank, the type of fish being fed, the frequency and amount of food required, and the type of food being used. It's also important to properly clean and maintain the machine to prevent food contamination and ensure the health of the fish.

Increased production capacity: Twin screw extruders can handle higher volumes of raw materials and produce a larger quantity of finished product in a shorter period of time.

Improved nutrient retention: The high shear forces and cooking temperatures generated by twin screw extruders enable better protein and starch digestion, leading to improved nutrient availability for fish.

Better texture and appearance: Twin screw extruders can provide a more uniform texture and consistent shape to the fish feed pellets, enhancing their appearance and palatability.

Versatility in processing: Twin screw extruders can process a wide range of raw materials, including grains,

legumes, and oilseeds, allowing for the formulation of specialized diets tailored to specific fish species.

Cost-effectiveness: The use of twin screw extruders can reduce the cost of fish feed production by minimizing waste, improving efficiency, and increasing profitability.

Enhanced shelf-life of feed: The cooking process used in twin screw extruders sterilizes the feed, extending its shelf life and reducing the risk of spoilage.
